

CROP PROTECTION - INSECT NETTING

Insect Netting

Designed to protect fruit and vegetable crops from insect attacks, but also gives protection from birds, rabbit and deer. The net creates a micro climate by giving shelter to the crop, but only increases the temperature by 1-2 degrees centigrade. Insect net must be laid slack as it does not stretch. Enough net must be left to secure it at the edges and for plant growth. Insect nets are best secured by soil as it creates a complete seal around the edges to exclude insects.

Cabbage and Carrot Root Fly Nets

(1.3mm mesh)

code **NETT26**

Works for cabbage and carrot root fly.
Suitable for conventional and organic growing.
